

DSHS revised its method for reporting Total Tests, effective 9/14/2020. DSHS will now only report electronic lab results that have passed quality checks and have cleared into the state's system of record, NEDSS, the National Electronic Disease Surveillance System. This improvement is possible due to recent upgrades to NEDSS, which now processes data more quickly.

The revised methodology ensures data is fully deduplicated and that only tests that passed through the data submission quality checks are counted in Total Tests. Test submissions that error out of the system due to data quality issues will not be counted until they are successfully resubmitted and pass validation requirements. Additionally, Total Tests will no longer include faxes or aggregate counts received by various labs since there is not a timely way to complete data quality checks.

Tests by Type as of 10/31/2020

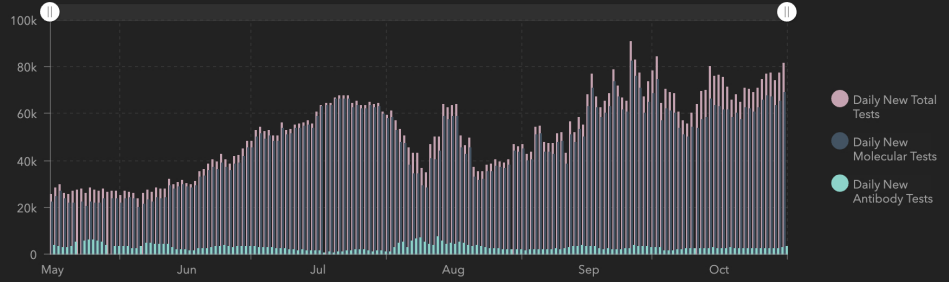

Total Tests Reported 9,132,291	Total Molecular Tests 8,291,703
Total Antigen Tests 350,556	Positive Antigen Tests 29,010
Total Antibody Tests 490,032	Positive Antibody Tests 48,164

Total Tests Reported

Total tests displayed here prior to 9/13 are raw test counts reported electronically and non-electronically and were unable to be de-duplicated. Beginning 9/13, the total test numbers include only validated tests in NEDSS, the National Electronic Disease Surveillance System. All data are provisional and subject to change over time.

Daily New Tests (7 day average)

Due to technical issues, data processing could not be completed for viral and antibody lab tests on May 23. Consequently, we are unable to calculate the seven-day average of viral or antibody tests for May 23 and May 30.
